ACCURACY FEEDBACK

✓ WHAT YOU DID WELL

- You showed your code editor and opened your browser to show the web page output using Live Server.
- You showed the layout parts clearly, saying 'At the top I have added my course heading and the navigation menu' and 'Finally I have added the footer at bottom'.
- You showed headings and text in your code and explained that 'Each course has a short description explaining what we learn in the subject'.

⚠️ WHAT COULD YOU DO BETTER

- Video content does not match expected topic. Expected: Let's Build Your First Website: The Home Page (creating a basic homepage using only HTML). Shown: A review of a pre-written courses page (courses.html) from your student portal.
- You did not explain what the <head>, <body>, and <title> tags do. The <head> tag stores page details, <title> names the tab, and <body> holds everything users see.
- You did not explain how the <a> tag works to make links. You showed a menu list, but you did not explain the anchor tag or the href attribute.
- You showed headings and paragraphs on screen, but you did not explain how to code them using <h1> to <h6> tags and <p> tags.

🎯 SUGGESTION FOR TECHNICAL ACCURACY IMPROVEMENT

- Practice explaining the basic HTML structure by talking through <!DOCTYPE html>, <html>, <head>, <title>, and <body> one by one.

- Teach how to make links by typing Link Name and explaining what href means.
- Show how heading tags work from <h1> as the largest to <h6> as the smallest, and how <p> tags create blocks of text.
- Make sure to build a homepage step-by-step as asked in the topic, instead of reading through code from another page.

☆ ABILITY TO EXPLAIN FEEDBACK

✓ WHAT YOU DID WELL

- You gave a clear introduction by stating you will explain the courses page of your student portal.
- You followed a clear logical order, moving through the HTML code from top to bottom before opening Live Server.
- You correctly identified key web sections like the navigation menu, course headings, and footer.
- You ended the video nicely with a polite conclusion and showed the final rendered browser output.

⚠️ WHAT COULD YOU DO BETTER

- You did not use any analogies or comparisons to help explain how HTML structure works.
- You did not explain the purpose or importance of core tags like <head>, <body>, or <title>.
- You focused mostly on reading your code content rather than explaining how the underlying HTML tags function.
- You did not mention real-world applications or why proper web structure is important for users.

🎯 SUGGESTION FOR IMPROVING EXPLANATION

- Try using an analogy, like comparing the <body> tag to the main content of a book and the <head> tag to the book cover details.
- Explain why specific tags are used, such as explaining how anchor <a> tags connect different web pages together.
- Show a quick live code change to demonstrate how changing an HTML tag directly updates the browser view.
- Explain the concept of web page layout from basic principles before diving into your specific code project.
